# PYTHON PROGRAMMING

21 Days Challenge

Day-04

Day-04

# STRING- INDEXING, SLICING AND FORMATTING, PROPERTIES AND METHODS

# Instructor

**Abdullah Al Zubaer**
Instructor – Artificial Intelligence & Data Science
B.Sc. in Internet of Things and Robotics Engineering
Gazipur Digital University, Gazipur, Bangladesh

# Table Of Content

String - Indexing

String - Properties

String - Slicing

String - Methods

String - Formatting

# String

string is a sequence of characters
enclosed in quotes

**String = ‘Gobeshona Learning’**

# String - Indexing

Indexing is the process of accessing individual characters in a string using their position (index).

a = "**bangladesh**"

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|---|---|---|---|---|---|---|---|---|
| **b** | **a** | **n** | **g** | **l** | **a** | **d** | **e** | **s** | **h** |
| -10 | -9 | -8 | -7 | -6 | -5 | -4 | -3 | -2 | -1 |

**print(a[4])**

# String - Slicing

Slicing is a way to extract a portion (substring) of a string by specifying a start index, end index, and an optional step.

```
string [ start : stop : step ]
```

```
a = “bangladesh”
```

```
print(a[6:10])
print(a[6:])
print(a[-4:])
```

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|---|---|---|---|---|---|---|---|---|
| **b** | **a** | **n** | **g** | **l** | **a** | **d** | **e** | **s** | **h** |
| -10 | -9 | -8 | -7 | -6 | -5 | -4 | -3 | -2 | -1 |

# String - Methods

String methods are built-in functions use to modify the string.

```
print(variable.function())
```

```
a = “banglaDesh”
```

- upper()
- lower()
- strip()
- replace()
- split()

# String - Formatting

String formatting allows you to insert variables or values into a string in a readable and structured way.

```
name = "Alice"
age = 25

print(f"My name is {name} and I am {age} years old.")
print("Name: {}, Age: {}".format(name, age))
```

# Escape Character

Escape character is used in strings to insert special characters that are otherwise hard or impossible to include directly.

```
print("Line1 \n Line2")          # New line
print("Name:\t Gobeshona")         # Tab space
print("She said, \"Hello\" ") # Double quotes inside string
print('It\'s Python')          # Single quote inside string
```

use only ‘ \’ before special characters

# QUESTION SESSION

THANK YOU
